Integration (end-to-end checklist)

Backend (dotnet-integration) + frontend (angular-integration) + verification:

1. Backend runs: `GET /api/ai/info` → `success: true`, expected providers.
2. Chat works: `POST /api/ai/chat {"message":"hi"}` → `data.reply`.
3. Translation works: `POST /api/ai/translation/translate` → `data.translatedText`.
4. Frontend points at the backend (`AI_SUITE_CONFIG.apiBaseUrl` per `environment.ts`); widget sends, switcher switches, panel lists services.
5. Production hardening (security): auth on, rate limit on, exact-origin CORS, HTTPS, keys in Key Vault/env — none in the browser.
6. Sample to click through: run `samples/SampleApi`, open `/demo.html` (popup widget + panel + streaming + voice + i18n badge).
