Versioning

Semantic versioning `MAJOR.MINOR.PATCH`. All `Pixous.AI.*` NuGet packages are versioned **in lockstep** (current: **1.0.0**); `@pixous/ai-suite` (NPM) tracks the backend contract it targets (1.0.0 ↔ `/api/ai` + envelope).

- `1.x` — backward-compatible: new providers, endpoints, options, additive envelope fields. Upgrading = bump package, no code changes.
- `2.x` — breaking changes (route/DTO/interface renames). Any 2.x ships with a migration note appended here describing exactly what moved.
- Rules: envelope shape never breaks in a minor; provider `ProviderName` strings are stable identifiers (renaming one is a major); `AiSuiteOptions` gains optional members only in minors.
